Dear Hiring Manager,

I am writing to express my interest in the Software Development Engineer I position at Amazon. I am currently pursuing a B.S. in Computer Science at the Georgia Institute of Technology, with concentrations in Modeling & Simulation and Information Internetworks, and I bring hands-on experience building scalable, data-driven systems in fast-paced, production environments. Through internships at Bank of America and UPS, I gained hands-on experience with cross-functional teams- an environment that mirrors Amazon's emphasis on ownership, collaboration, and long-term impact.

During my internship as a Software Engineer Intern at Bank of America, I worked on large-scale internal platforms supporting over 10,000 projects across eight lines of business, where success depended on both technical implementation and communication. I collaborated with engineers, product partners, and analysts to design full stack tools that surfaced insights from complex data and aligned with the needs of multiple teams. In addition to building Python applications, I also standardized shared visualization libraries, reducing duplicated work and improving maintainability across teams. This experience taught me how clear documentation, reusable components, and thoughtful design choices enable teams to move faster together.

Previously at UPS, I focused on building resilient automation and analytics pipelines using Python, Google Cloud Functions, and BigQuery. These projects required close coordination with finance and accounting stakeholders to ensure accuracy, auditability, and long-term reliability. By translating non-technical requirements into data pipelines and monitoring logic, I reduced manual labor by over 20 hours per week and delivered tools that are still in recurring reporting processes. This reinforced my appreciation for writing clean, well-documented code that others can trust and maintain.

Beyond internships, I have pursued projects that explore how emerging technologies- particularly AI- can be applied reasonably in real systems. Over the past year I have worked with a team of engineers to conduct campus research and build an AI-powered campus matching platform leveraging OpenAI's API to improve user engagement. Projects like these help me think critically about system design and where automation meaningfully improves user experience.

I am excited by the opportunity to contribute to Amazon's customer-focused products while continuing to grow as a collaborative, thoughtful engineer. I would welcome the opportunity to discuss how my background and interests align with Amazon's Software Development Engineer role. Thank you for your time and consideration.
